Mac OS 8 is easily the most intuitive and responsive Mac operating system ever

Mac OS 8 is a quantum leap toward the future of computing. So powerful, responsive and easy to use, it's out of this world. Multitasking is a reality. Internet access is an integral part of the system. A powerful suite of multimedia tools is at your command. And productivity is light years ahead.

This is Mac OS 8. From Apple.

Just power up your computer. Slip in the CD. Follow the step by step instructions and it's installed. Mac OS 8 is automatically configured for networking, file sharing and printing. And the Interactive Assistant guides you through everything, from setting the time, date and location, to setting your Finder operating system software and other preferences for your personal computing style, comfort and level of proficiency.

You were asking for multitasking?

At the core of the Mac OS 8 is the new PowerPC native, multitasking, multi-threaded Finder. It takes full advantage of PowerPC processors. So it's lightning fast. You can run multiple

applications more smoothly. And do multiple tasks like duplicate files, install new software and empty the trash, simultaneously. Without standing by while the clock takes a spin.

Instant Internet

Internet access is built into Mac OS 8. Once installed, you have one-click access to a universe of information.

An Internet Setup Assistant helps you configure your system. Your choice of browser, Netscape Navigator 3.0.1, Internet Explorer and Cyberdog 2.0 Internet software are all on board. You can visit web sites from all applications using the "Connect To" shortcut in your Apple menu*.

Download Java applets from the Internet and run them on your desktop with 100% native Java. Start sending and receiving email immediately after setting up your account. And use Personal Web Sharing to share documents on the Internet and on your intranet with anyone, using a standard web browser.

* You must be registered with an Internet Service Provider

Powerful Multimedia is yours today

Imagine producing high-impact multimedia communications, complete with video, 3D graphics, virtual reality scenes and audio. Mac OS 8 gives you that power. QuickTime Media Layer (QTML) is the industry standard for cross-platform media authoring and playback, and includes the QuickTime VR application program with its gallery of virtual reality objects. And the QuickDraw 3D application program, which brings real-time, workstation-class graphics to your Mac.

Now PC files meld with Mac

Mac OS Easy Open lets you view and edit Windows and DOS files, even if you don't have the application in which they were created. And with MacLinkPlus Version 9 translators, you can convert Windows or DOS files to Mac OS, and vice versa.

What a difference 8 makes

Mac OS 8 is so fast, responsive and easy to use, it will make all the difference in the world.

New look. New feel. New features. One look will tell you Mac OS 8 is dramatically new. The desktop has a stunning, updated look and feel. And it's loaded with performance-boosting features.
